

Listing of Claims:

1. (Currently Amended) A projection device comprising:

a projection unit which projects an image on a screen based on image data provided to the projection unit;

a storing unit which stores template image generation data for generating template images that have predetermined content and a blank space to be filled in by a user;

a control unit which obtains the template image generation data for generating one of the template images from said storing unit, provides generated template image data based on the obtained data to said projection unit, and causes the projection unit to project the template image based on the template image data;

an imaging unit which captures an image of the screen; and

an image recording unit which stores an image captured by the imaging unit.

2. (Currently Amended) The projection device according to claim 1, wherein:

said storing unit stores pixel pattern information of said template images as said template image generation data for generating said template images; and

said control unit obtains the pixel pattern information from said storing unit, and generates said template image data, based on the obtained pixel pattern information.

3. (Currently Amended) The projection device according to claim 1, wherein:

said storing unit stores template data for drawing ruled lines and generating said template images, as said template image generation data ~~for generating said template images~~, and

said control unit obtains said template data from said storing unit, and generates said template image data to have ruled lines drawn based on the obtained template data.

4. (Withdrawn) The projection device according to claim 3, comprising:

an indication unit which indicates an editing position in said template image projected on said screen, and

an input unit which inputs editing content of data that corresponds to said editing position, based on the obtained editing position,

wherein said control unit obtains information of the editing position indicated by said indication unit, specifies data corresponding to said editing position based on the obtained editing position, obtains the specified data from the storing

unit, and edits the obtained data based on the editing content input by the input unit.

5. (Withdrawn - Currently Amended) The projection device according to claim 4, wherein:

said storing unit stores ruled line data that defines ruled lines that are to be drawn, as said template data, and

5 said control unit specifies ruled line data that corresponds to said editing position, based on the obtained editing position information, and obtains the specified ruled line data from the storing unit.

6. (Withdrawn - Currently Amended) The projection device according to claim 5, wherein:

5 said ~~storing unit stores~~ ruled line data ~~including~~ stored by the storing unit includes ruled line attribute information that indicates an attribute of the ruled ~~line that is~~ lines to be drawn, and

 said control unit edits the ruled line attribute information ~~including said rule~~ for the specified ruled line data, based on the editing content input by said input unit.

7. (Withdrawn) The projection device according to claim 4, wherein:

said storing unit stores cell data that defines a cell that
is surrounded by ruled lines that form said template images as
5 said template data, and

said control unit specifies cell data that corresponds to
said editing position, based on the obtained editing position
information, and obtains the specified cell data from said
storing unit.

8. (Withdrawn - Currently Amended) The projection device
according to claim 7, wherein:

said ~~storing unit stores~~ cell data ~~that~~ stored by the
storing unit includes cell attribute information indicating
5 an attribute of cells, and

said control unit obtains cell attribute information
~~including for~~ said specified cell data from said storing unit,
edits the obtained cell attribute information, based on the
editing content that said input unit input, and stores the edited
10 cell data to said storing unit.

9. (Withdrawn) The projection device according to claim 4,
wherein:

said indication unit radiates spot light to said screen, and
said control unit controls the imaging unit to carry out
5 imaging of the screen where said template image is projected, and

said spot light is radiated, obtains a position relationship of the spot light from said indication unit and said template image from the image captured by said imaging unit, and obtains editing position information of said template image based on the obtained position relationship.

10. (Currently Amended) A projection device comprising:
a projection unit which projects an image to a screen based on image data provided to the projection unit;

5 a storing unit which stores template image generation data for generating template images that have predetermined content and a blank space to be filled in by a user;

an imaging unit which captures an image of said screen;

a command reception unit which receives commands for controlling said projection unit and said imaging unit, and

10 a control unit which provides the template image generation data for generating one of the template images ~~stored in said storing unit~~ to said projection unit and causes said projection unit to project the template image to the screen, in accordance with a projection command received by said command reception
15 unit, and controls said imaging unit to capture an image of said screen, in accordance with an imaging command received by said command reception unit.

11. (Currently Amended) A projection system comprising:
a projection device; and
an image storing device;
wherein said projecting device comprises:

5 a projection unit which projects an image on a screen
based on image data provided to the projection unit;

a storing unit which stores template image generation
data ~~of for generating~~ template images that have a blank space to
be filled in by a user having predetermined content;

10 an imaging unit which captures an image of said screen;
and

a sending unit which sends data; and

a control unit which provides the template image
generation data for generating one of the template images to said
15 projection unit and causes said projection unit to project the
template image, which has a blank space to be filled in by a
user, to the screen, and controls said imaging unit to capture an
image of said screen; and

wherein said image storing device comprises:

20 a storing unit which stores data of document images
~~that are projected to said screen;~~ and

a control unit which extracts data of said document
images from said storing unit, sends the extracted image data to
the projection device to be projected to said screen, receives

25 data of an image sent from the projection ~~devices~~ device, and
stores data relating the received image data to data of said
document image to said storing unit.

12. (Currently Amended) A method ~~which~~ comprising:
projecting a template image, which ~~has predetermined~~
content has a blank space to be filled in by a user, to a screen;
and
5 capturing an image of said screen where said template image
is projected.

13. (Currently Amended) The method according to claim 12,
further comprising:
storing data of the template image, which has the blank
space to be filled in by a user, to be projected to said screen
5 beforehand; and
extracting said stored data of the template image,
wherein the projected template image corresponds to the
extracted data of the template image.
